CSC 242

Lab 6

Write a program that solves the maze problem discussed in Chapter 7. You should use the **Grid** class developed in Chapter 4 in this problem. The program should input a description of the maze from a text file called maze.txt, at start-up. The program then displays this maze, attempts to find a solution, displays the result, and displays the maze once more. Also, write the solution of the original input maze to a file called solution.txt. A sample input file (maze1.maz) is provided in **Extra Files** under **Content**.
